

Supplements Store - Requirements & Development Plan

1. Project Overview Build a web and mobile application for a supplements store that enables users to browse products, make online payments, and track their orders. Admins can manage products, orders, and inventory.

Requirements of Different Roles:

1. Users

- The system shall allow users to register with a name, email, and password.
- Each user must have a role assigned (CUSTOMER or ADMIN)
- Login functionality should validate credentials securely.
- Admins can access customer data for management.
- Users should be able to update profile information.
- Every user will have a creation timestamp for audit tracking.

2. Products

- Admins can create and manage product listings.
- Each product must include name, description, and category.
- Products are linked to one or more variants (flavor, size).
- Products should be searchable by category or keyword.
- Each product record should log its creation time
- Deleting a product should also remove its variants.

3. Product Variants

- Variants are specific versions of a product (e.g., 500g Mango).
- Each variant must include flavor, weight, price, and stock.
- An image URL can be linked for product display.
- Variants must reference a parent product.
- Stock should be updated automatically after purchases.
- Admins can add, update, or delete variants.

4. Cart Items

- Customers can add multiple items (variants) to the cart.
- Quantity should be selectable and validated against stock.
- Each cart item links a user to a product variant.
- Users can update or remove items before checkout.
- Carts are user-specific and cleared after order placement.
- A timestamp records when items are added to the cart.

5. Orders

- Customers can place orders for the items in their cart.
- Each order records the total amount, delivery address, and status.
- Payment status should be tracked (PENDING, PAID, FAILED).

- Order status must reflect delivery stages (PROCESSING, SHIPPED, DELIVERED).
- Order data includes a creation timestamp.
- Orders are associated with the user who placed them.

6. Order Items

- Each order contains multiple order items.
- Each order item links to a specific product variant.
- Quantity and price are recorded per item.
- These records support invoice generation and stock management.
- Deleting an order should cascade delete its items.

Noun's in Different Roles:

1. Users

- system, name, email, password
 - role
 - login, credentials
 - management
 - profile information
 - timestamp, audit tracking
-

2. Products

- listings
 - description, category
 - variants, flavor, size
 - keyword
 - record
-

3. Product Variants

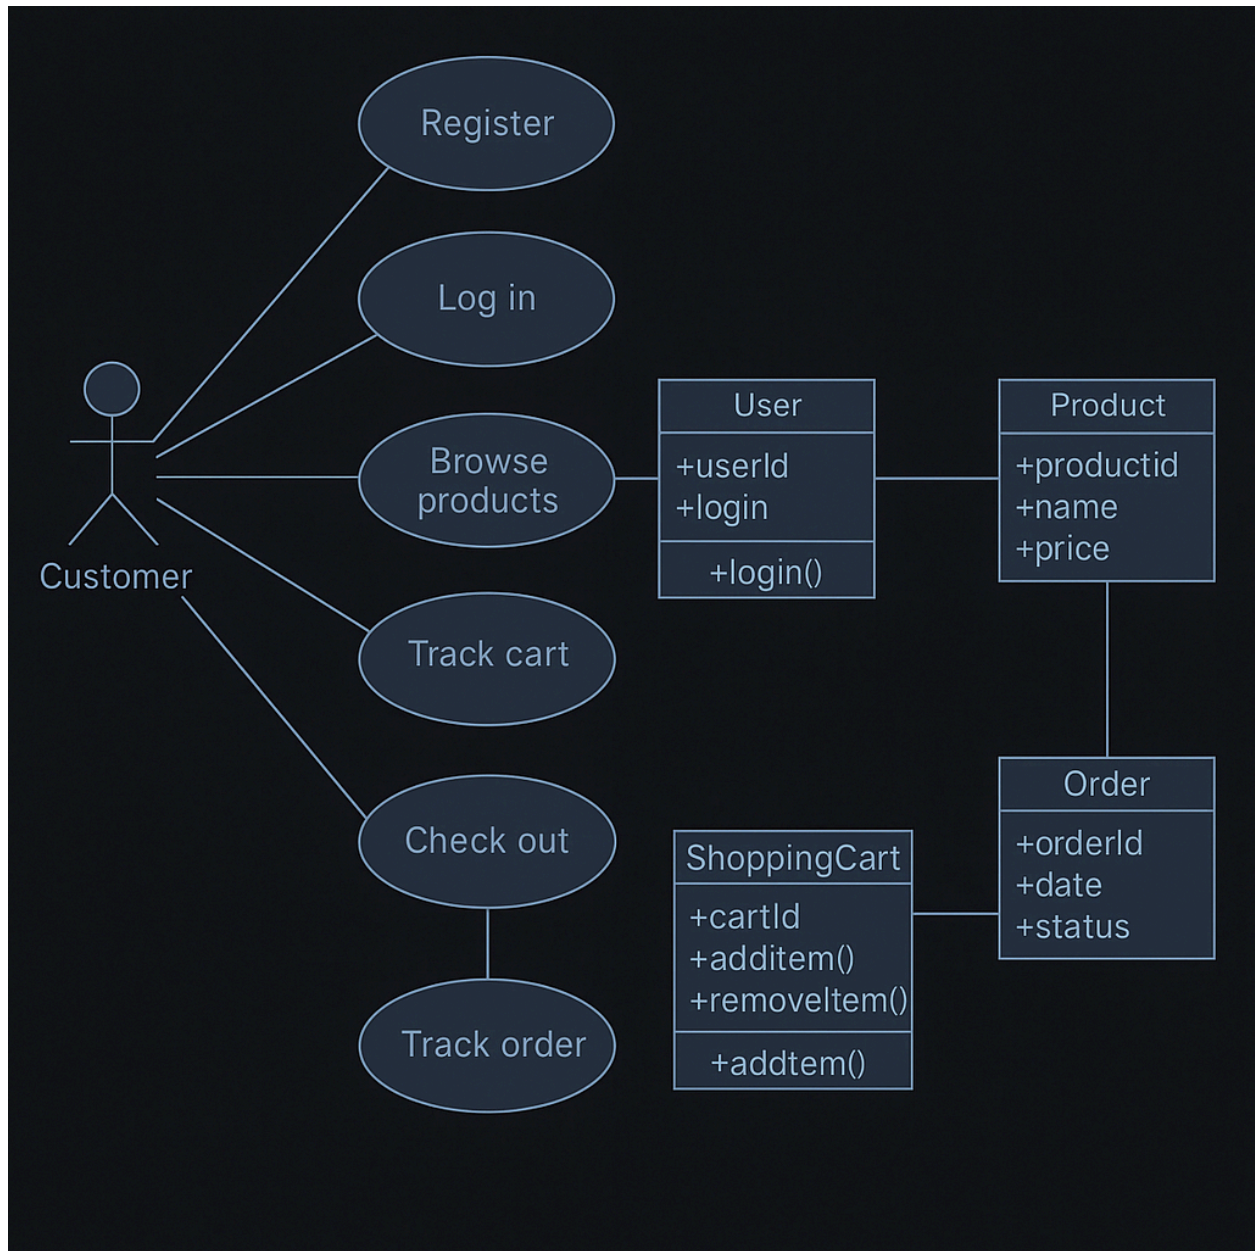

- versions
 - weight, price, stock
 - image URL, display
 - parent product
 - purchases
-

4. Cart Items

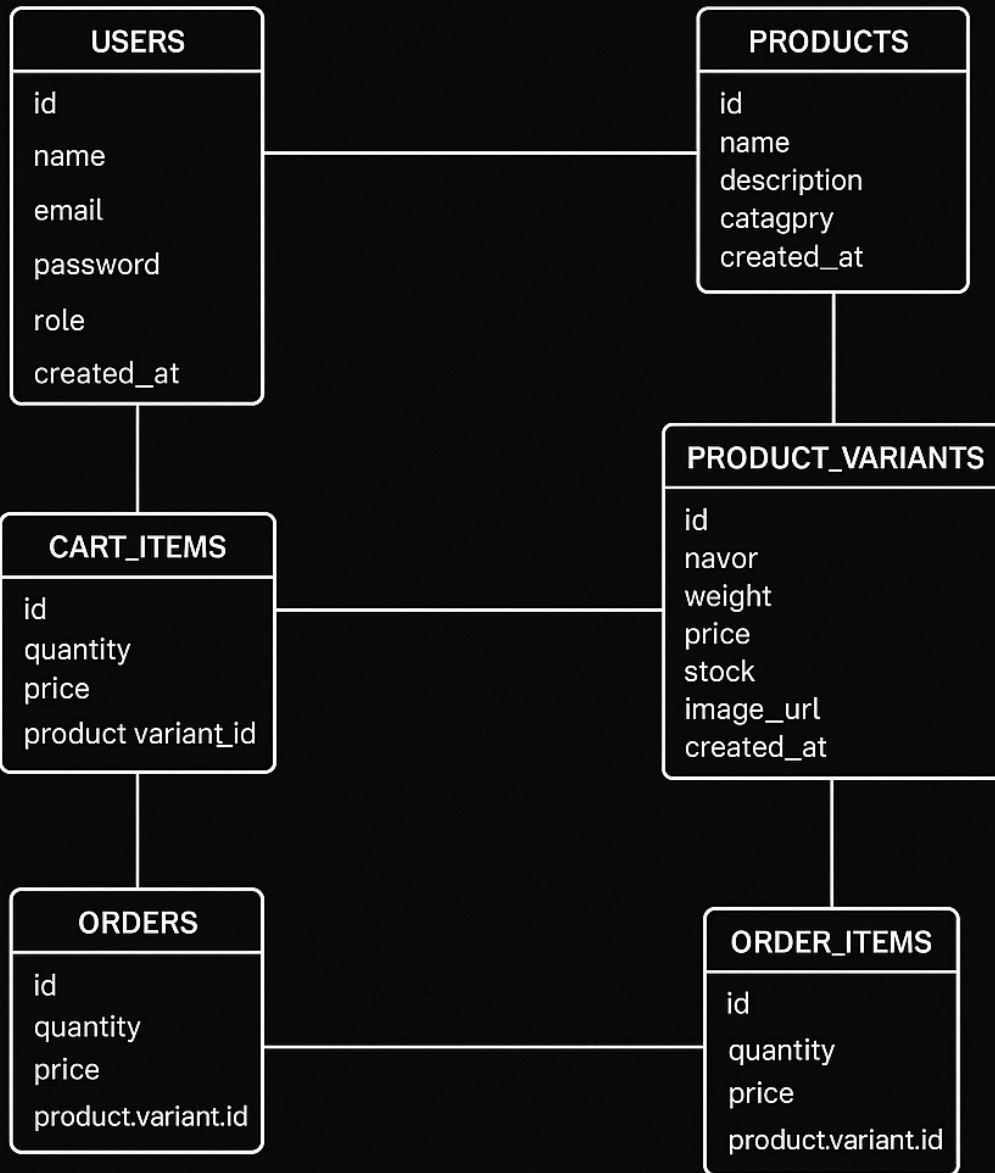

- items, cart
 - quantity
 - checkout
-

5. Orders

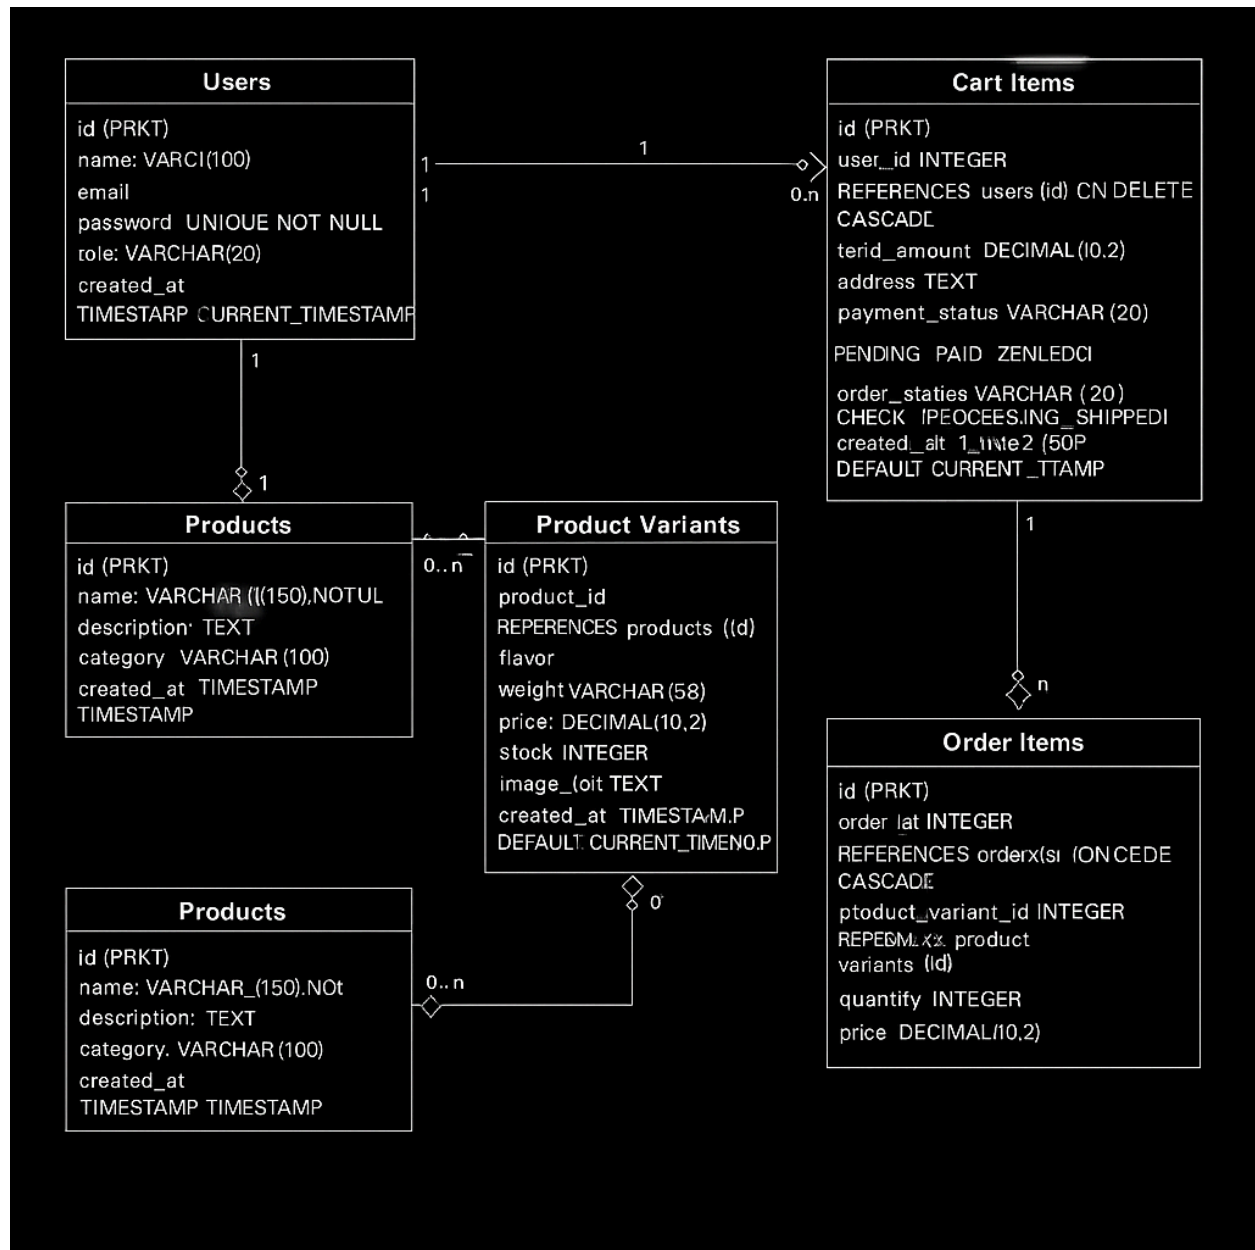

- total amount, delivery address, status
- payment status
- delivery stages
